

FOR HOTEL OWNERS AND OPERATORS

Orpheus Hospitality Suite

The property-level guest experience layer — in-room entertainment, dining, concierge, facility booking, payments and digital documents — running on one guest record and plugged into the enterprise systems you already own.

Runs on the TV. No set-top box.

Powered by Orpheus Nations.

THE PROBLEM

The core is solved. The last mile is not.

Central reservations, the property management system and the loyalty programme are enterprise-grade and estate-wide. Below them, the systems the guest actually touches were bought property by property, from whoever was local.

ESTATE-WIDE, ENTERPRISE, YOURS

Central reservations

One inventory, one rate strategy

Property management system

Opera-class, standardised across the estate

Enterprise loyalty

One programme, one member identity

Corporate finance and reporting

Consolidated to the group

PROPERTY BY PROPERTY, LOCAL, INCONSISTENT

In-room television

Sold with the hardware, different vendor per site

Restaurant and bar point of sale

Often two systems, rarely reporting to the group

Concierge and service requests

Radio, paper log, or a spreadsheet

Guest identity documents

Photocopied, filed, retained indefinitely

WHAT IT COSTS AT ESTATE SCALE

Property fragmentation is paid at the group

Per site vendor contracts

TV, POS, concierge and document handling procured locally — renewed locally, audited locally

Uneven guest experience

the same brand promise delivered differently in every property the guest visits

Partial ancillary data

outlet, spa and in-room revenue that never rolls up cleanly to the group

Siloed document risk

identity documents held at property level, with no estate-wide retention control

Characteristic of multi-property estates with locally procured guest-facing systems. Replaced with the group's own vendor inventory at proposal stage.

THE IDEA

One guest layer. Every property.

The guest is identified once and read by every surface below the enterprise stack — consistently, in every property, whatever the brand standard requires.

One deployment model, repeated per property — so the estate converges instead of diverging.

INTEGRATION

Where we sit in your stack

We do not replace central reservations, the property management system, or the loyalty programme. We consume them, and we own the layer they do not reach.

Integration is scoped per PMS and per loyalty platform. We do not promise a generic connector — the interface is agreed before the pilot.

AT A GLANCE

Nine modules, one platform

ID

Identity & Documents

Scanning, OCR, e-signature, secure vault, statutory guest register

CR

Guest Profile

Preferences, allergies, stay and spend history, consent ledger

BK

Booking

Direct engine where you need one; pre-arrival upsell on every reservation

RV

Reservations

Tables, spa, gym, function rooms, tours, transfers

PY

Payments & Folio

Cards, wallets, room charge, split billing, settlement

OR

Ordering

Restaurant, bar, in-room dining, QR, kitchen display

SV

Concierge & Service

Requests, SLA ticketing, housekeeping, maintenance, chat

TV

Entertainment

Guest TV application, live and on-demand, Orpheus Nations, casting

OP

Operations

Property and estate dashboards, RBAC, multi-property, audit

Adopted as a whole, or module by module against the gaps in a given property — the guest record is shared from the first one.

END TO END

What the guest actually experiences

Step six is the one only a group can offer — and today almost none do.

01

Arrival, digitalized

From photocopied passports held at property level to a scanned, parsed, signed and centrally retention-managed record — under one policy across the whole estate.

The filing cabinet, retired — estate-wide

1

Scan

Passport, national ID or licence. The guest's own phone works for pre-arrival capture.

2

Parse

Machine-readable zone and field OCR extract name, number, nationality and expiry. No typing.

3

Sign

Registration card pre-filled from the scan, signed on a tablet or the guest's phone.

4

Vault

Encrypted storage under a separate key. Every read logged with actor, time and reason.

5

Purge

One retention policy, set by the group, enforced per property, with a provable deletion trail.

Also in the vault

Folios and invoices · signed contracts and banquet event orders · incident reports · supplier documents · the statutory guest register, exportable per jurisdiction for police and immigration filing

The guest, remembered across the estate

What the property record holds

- Preferences captured once — floor, bed, pillow, newspaper, language
- Allergies and dietary restrictions, which reach the kitchen ticket as a hard warning
- Spend across every outlet, not just room revenue
- Service history: what was asked for, how fast it was delivered, what went wrong
- A consent ledger recording what was agreed, when, and which version of the text was shown

What it changes

Loyalty gets substance

Your programme knows the stays. This adds what they ate, asked for and cared about.

The allergy

Flagged at the kitchen, not remembered by a waiter who is off shift tomorrow.

Portability

A preference set in one property is honoured at the next one in the estate.

Recovery

A service failure is visible to the next property before the guest has to repeat it.

Rooms are yours. The rest has no system.

We do not compete with central reservations for room inventory. We take the reservation as an input, and we run the demand your enterprise stack was never built to handle.

Rooms — yours

- Central reservations remains the system of record
- We consume the confirmed reservation, and return the stay
- Direct booking engine available where a property needs its own
- Pre-arrival upsell layered on any reservation, whatever its channel

Everything else — ours

- Restaurant tables, by service and by section
- Spa treatments and therapist availability
- Gym classes, courts, equipment and pool cabanas
- Function and meeting rooms, with banquet event orders
- Tours, transfers and airport pickup

One capacity engine serves every resource — a table, a therapist, a boardroom and a shuttle seat are the same problem, solved once and deployed estate-wide.

Every charge, one folio

Bar, restaurant, spa, minibar, laundry, the television — every outlet posts through one interface, and the folio reconciles to the property management system you already run.

Four ways to order. One kitchen.

01

At the table

Server on a tablet, or the guest scans the code and orders without waiting.

02

At the bar

Tabs that follow the guest and close to the room, not to a card at the till.

03

From the room

In-room dining on the television or the phone, posted to the folio automatically.

04

Anywhere on site

Poolside, lobby, terrace. The code carries the location; the order knows where to go.

Behind all four

Kitchen display

Tickets routed by prep station, courses fired in order, bar split from kitchen.

Live menu control

Remove an item once and it clears the television, the codes and the tablets at once.

Margin, not just revenue

Recipe costing and stock depletion roll outlet profitability up to the group.

Every request in one queue

A guest asks by television, by phone, by chat or at the desk. Staff see one list. Head office sees whether the brand standard was met.

How a request moves

- 1 Raised — from any channel, tagged to the stay
- 2 Classified — type, priority, target time
- 3 Assigned — to a person, not to a department
- 4 Clocked — the SLA runs, and escalates if it breaches
- 5 Closed — logged against the guest, the room and the property

Housekeeping

Room status, turn-down, linen, inspection and out-of-order rooms on one board.

Maintenance

Work orders with asset history, so a recurring fault becomes visible as a pattern.

Brand standard reporting

SLA attainment per property, comparable across the estate, without a manual audit.

02

The screen in the room

The highest-dwell-time surface in the room, procured locally in most estates, and the least consistent thing a returning guest encounters.

From a television into the hotel itself

Good evening, Ms Reyes

Room 812 · 2 nights remaining · Gold member

Services and wayfinding

Bill

Folio and express checkout

Personal on arrival

Name, nights remaining and loyalty tier — drawn from the same record the front desk reads.

Identical in every property

One application, one interface, one brand standard, whatever is on the wall.

Revenue, not just cost

The remote reaches room service, the spa and the bar. The screen begins to earn.

Reset between guests

Profile, cast pairings, history and cached logins cleared automatically on turnover.

WHY IT MATTERS AT ESTATE SCALE

No box behind the television

	Traditional hotel TV	Orpheus Hospitality Suite
Hardware per room	A set-top box, a power supply, an HDMI lead, a mount	Nothing. The application runs on the television
Install per property	Every room cabled and provisioned individually	One firmware profile, cloned across the estate
Failure points	Box, power supply and cable — all guest-accessible	The television, already under warranty
Guest input	A second remote, and a lesson in which one to use	The remote that came with the television
Refresh cycle	Boxes age and are replaced on their own cycle	On the television capex plan you already have

Requires hospitality-model televisions, which permit managed installation and lockdown. Existing consumer estates run the same application on a small device until refresh.

Whatever is already on the wall

One backend, thin clients. Personalisation, ordering and billing all sit server-side; the television renders and takes input. That is what lets a mixed estate converge on one guest experience without a single-vendor hardware commitment.

TCL

Google TV / Android TV

Native Android TV application, managed install across the estate.

Samsung

Tizen hospitality

HTML5 application on Samsung's hospitality stack.

LG

webOS hospitality

HTML5 application on LG's Pro:Centric stack.

Mixed / legacy

Any brand

Same application on a small device, until the televisions refresh.

Before we quote, we survey

Television models per property, and whether they are hospitality SKUs · per-room network to each set · VLAN separation of guest and device traffic · multicast, where live television is carried over IP

THE CONTENT LAYER

Entertainment, powered by Orpheus Nations

No property negotiates with a distributor, assembles a library, or maintains a player. The entertainment layer is licensed centrally as part of the platform and deployed identically across the estate.

1

A curated catalogue

On-demand entertainment presented inside your interface, not a third party's.

2

Live television

Local and international channels with a proper programme guide, over the room network.

3

The guest's own services

Casting and mirroring from their phone, so their subscriptions travel with them.

4

Your channels

Property information, dining, spa, events and promotion, alongside the entertainment.

The entertainment is why the guest picks up the remote. Everything else in this deck is why the operator is glad they did.

Owner and operator want different things

In a branded estate the party funding the capital expenditure and the party setting the standard are rarely the same. The platform has to answer to both.

The owner

funds it

- Ancillary revenue per occupied room, from a screen that previously earned nothing
- Local vendor contracts consolidated into one line
- Set-top hardware removed from the refresh plan
- Labour hours returned at the desk, the outlets and night audit
- An asset that improves on the schedule the televisions are replaced on anyway

The operator

sets the standard

- One guest experience across every property, not one per procurement decision
- Service SLAs measured continuously rather than by mystery shopper
- Brand standard compliance evidenced from operational data
- Guest preferences portable between properties in the estate
- Document retention under one policy, enforced everywhere

THE COMMERCIAL CASE

Where the platform pays for itself

Five effects, each measurable on a property P&L and each multiplying by the number of properties. The chart is a worked model — we rebuild it on the group's real figures before proposal.

How to read this

Bars are relative, not absolute. Ancillary revenue is set to 1.0 and the rest scaled against it.

The middle three bars are cost, not revenue — contracts not renewed, hours not worked, hardware not bought. They are the least visible effects and usually the most certain.

At estate scale the multiplier matters more than the per-property figure: a modest, reliable effect across two hundred properties outweighs an optimistic one across ten.

Illustrative model only. No client figures have been used. Rebuilt on the group's own outlet revenue, vendor spend, payroll and capex plan at proposal stage.

Built for your vendor review

Guest documents

Identity scans encrypted under a separately managed key, released only with a reason code, purged on a group-set retention clock.

Card data

Never touches the platform. Capture device to acquirer; we hold a token. PCI scope stays on the light-touch assessment.

Access control

Role-based and least-privilege, federated to your identity provider. Group sees the estate, property sees itself.

Audit trail

Append-only log of every state change. Every privileged read carries actor, time and reason, exportable for review.

Data residency

Configurable per property and per region — a requirement for any operator across multiple jurisdictions.

Certification

SOC 2 Type II and an independent penetration test are committed deliverables, completed before pilot sign-off.

ROLLOUT

Pilot one property. Then the estate.

Nothing is committed estate-wide before it is proven in a property the group chooses.

1	Pilot — survey & foundation	Television and network survey. Guest record, identity capture and the document vault live in one property.	Weeks 1-6
2	Pilot — money & the room	Payments, folio, one outlet, and the guest television application. The full guest journey, one site.	Weeks 7-16
3	Pilot — measure	Ancillary revenue, SLA attainment and labour effect measured against the property's own baseline.	Weeks 17-20
4	Cluster	Three to five properties, deliberately mixed — different TV estates, different PMS versions, different markets.	Months 6-10
5	Estate	Standardised deployment runbook, regional teams, phased against the television refresh plan.	Month 11+

Phase 3 exists so the estate decision is made on measured results, not on this presentation.

NEXT STEPS

One pilot property, chosen by you, measured against its own baseline

1 **Systems and vendor audit**

What each property runs today, what it costs the group, and what the platform consolidates.

2 **Integration scoping**

Your PMS, loyalty platform and identity provider — interfaces agreed and documented, not assumed.

3 **Pilot proposal**

Commercial model rebuilt on your figures, with a measurement gate before any estate commitment.
